

# CliQ III DIN Rail Power Supply

## 24V 120W 1 Phase / DRP-24V120W1C□N

### Highlights & Features

- Universal AC input voltage range
- Built-in constant current circuit for charging application
- High efficiency of up to 91% at 230Vac
- Power Boost of 150% for 5 seconds
- Advanced Power Boost (APB) of 200% for 50ms
- SEMI F47 compliance at 120Vac
- Extreme low temperature cold start at -40°C
- Built-in DC OK Contact and LED indicator for DC OK
- Conformal coating on PCBAs to protect against common dust and chemical pollutants
- Certified according to IEC/EN/UL 62368-1

### Safety Standards

CB Certified for worldwide use

### General Description

The CliQ III series of DIN rail power supply series is designed with high power density and intelligent overload protection features. All the models in the series are encased in rugged yet lightweight and full corrosion resistant aluminium casing. The single output with universal input design offers overcurrent protection in constant current mode which makes the series suitable for charging application. Like the rest of the CliQ family of products, conformal coating is applied on the PCBAs to protect against common dust and chemical pollutant often found in harsh industrial environment. Delta CliQ III DIN rail power supply series features built-in Power Boost of 150% for 5 seconds. Such feature enables reserve power to be always available for reliable startup of loads with high inrush current without the need of a more expensive power supply at higher power rating.

### Model Information

#### CliQ III DIN Rail Power Supply

| Model Number    | Input Voltage Range | Rated Output Voltage | Rated Output Current |
|-----------------|---------------------|----------------------|----------------------|
| DRP-24V120W1C□N | 88-264Vac           | 24Vdc                | 5.0A                 |

### Dimensions

L x W x D: 124 x 40 x 117 mm (4.88 x 1.57 x 4.61 inch)

### Engineering Data

#### Output Load De-rating VS Surrounding Air Temperature

**Fig. 5 De-rating for Vertical Mounting Orientation**  
 > 60°C de-rate power by 2.5% / °C

**De-rating for Horizontal Mounting Orientation**  
 > 40°C de-rate power by 1.67% / °C

#### Note

1. Power supply components may degrade, or be damaged, when the power supply is continuously used outside the shaded region, refer to the graph shown in Fig. 5.
2. If the output capacity is not reduced when the surrounding air temperature exceeds its specification as defined on Page 5 under "Environment", the device will run into Over Temperature Protection. When activated, the output voltage will go into bouncing mode and will recover when the surrounding air temperature is lowered or the load is reduced as far as necessary to keep the device in working condition.
3. In order for the device to function in the manner intended, it is also necessary to keep a safety distance as recommended in the safety instructions while the device is in operation.
4. Depending on the surrounding air temperature and output load delivered by the power supply, the device can be very hot!
5. If the device has to be mounted in any other orientation, please contact [info@deltapsu.com](mailto:info@deltapsu.com) for more details.

### Assembly & Installation

The power supply unit (PSU) can be mounted on 35mm DIN rails in accordance with EN 60715. For Vertical Mounting, the device should be installed with input terminal block at the bottom. For Horizontal Mounting, the device should be installed with input terminal block on the left side.

Each device is delivered ready to install.

1. Tilt the unit upwards and insert it onto the DIN rail. Snap on the DIN rail as shown in Fig. 8.1.
2. Push downwards until stopped.
3. Press against the bottom front side for locking.
4. Shake the unit slightly to ensure that it is secured.
5. To uninstall, pull or slide down the latch with screw driver as shown in Fig. 8.2. Then slide the power supply unit (PSU) in the opposite direction, release the latch and pull out the power supply unit (PSU) from the rail.

#### Mounting

Fig. 8.1 Mounting

#### Dismounting

Fig. 8.2 Dismounting

In accordance to EN 60950 / UL 60950 and EN 62368 / UL 62368, flexible cables require ferrules. Use appropriate copper cables designed to sustain operating temperature of:

1. 60°C / 75°C for USA
2. At least 75°C for ambient up to 40°C (Canada)
3. At least 90°C for ambient > 40°C (Canada)

## 24V 120W 1 Phase / DRP-24V120W1C□N

### Safety Instructions

#### ■ Vertical Mounting

#### ■ Horizontal Mounting

- ALWAYS switch mains of input power OFF before connecting and disconnecting the input voltage to the device. If mains are not turned OFF, there is risk of explosion / severe damage.
- If the unit is used in a manner not specified by the manufacturer, the protection provided by the equipment may be impaired.
- **To guarantee sufficient convection cooling, please refer to the following instructions to ensure sufficient clearance around the device.**

**Vertical Mounting:** 40mm (1.57 inch) above and 20mm (0.79 inch) below the device as well as a lateral distance of 5mm (0.2 inch) to other units. In case the adjacent device is a heat source, the lateral distance will be 15mm (0.6 inch).

**Horizontal Mounting:** 40mm (1.57 inch) above and below the device as well as a lateral distance of 20mm (0.79 inch) to other units.

- The external enclosure where the unit will be installed shall meet the requirements for mechanical, electrical and fire enclosure.
- Note that the enclosure of the device can become very hot depending on the surrounding air temperature and output load connected to the device. Risk of burns!
- The main power must be turned off before connecting or disconnecting wires to the terminals.
- DO NOT insert any objects into the unit.
- Dangerous voltages present for at least 5 minutes after disconnected all sources of power.
- The power supplies are built in units and must be installed in a cabinet or room (condensation free environment and indoor location) that is relatively free of conductive contaminants.

# CliQ III DIN Rail Power Supply

## 24V 120W 1 Phase / DRP-24V120W1C□N

### ■ Graph illustrating the Start-up Time, Rise Time, and Hold-up Time

### Start-up Time

The time required for the output voltage before output voltage rise up, after the input voltage is applied.

### Rise Time

The time required for the output voltage to change from 0% to 95% of its final steady state set value.

### Hold-up Time

Time between the collapse of the AC input voltage, and the output falling to 95% of its steady state set value.

### Inrush Current

Inrush current is the peak, instantaneous, input current measured and, occurs when the input voltage is first applied. For AC input voltages, the maximum peak value of inrush current will occur during the first half cycle of the applied AC voltage. This peak value decreases exponentially during subsequent cycles of AC voltage.

### Dynamic Response

The power supply output voltage will remain within  $\pm 5\%$  of its steady state value, when subjected to a dynamic load from 0% to 100% of its rated current.

### ■ 50% duty cycle / 5Hz to 1KHz

# CliQ III DIN Rail Power Supply

## 24V 120W 1 Phase / DRP-24V120W1C□N

### Overvoltage Protection (Auto-Recovery)

The power supply's overvoltage circuit will be activated when its internal feedback circuit fails. The output voltage shall not exceed its specifications defined on Page 6 under "Protections".

### Overload & Overcurrent Protections (Auto-Recovery)

The power supply's Overload (OLP) and Overcurrent (OCP) Protections will be activated when output current ( $I_o$ ) is about 125% - 170%. In such occurrence, output voltage ( $V_o$ ) will start to droop and the  $I_o$  will limit to 8A typ. (refer to ③). After 5sec typ., the  $I_o$  will limit to 5.5A typ. (refer to ④). Once  $V_o$  is below approximately 18Vdc typ., the power supply will start to operate in "Hiccup mode" (refer to ⑤). The power supply will recover once the fault condition due to OLP or OCP is removed, then  $I_o$  is back within its specified limits.

It is not recommended to prolong the duration of output current when it is <125% but >100%, since it may cause damage to the PSU.

### Short Circuit Protection (Auto-Recovery)

The power supply's output Short Circuit Protection function also provides protection against short circuits. When a short circuit is applied, the output current will start to operate in "Hiccup mode". The power supply will return to normal operation after the short circuit is removed.

### Over Temperature Protection (Auto-Recovery)

As described in load de-rating section, the power supply also has Over Temperature Protection (OTP). In the event of a higher operating temperature at 100% load, the power supply will run into OTP when the operating temperature is beyond what is recommended in the de-rating graph. When activated, the output voltage will go into bouncing mode until the temperature drops to its normal operating temperature as recommended in the de-rating graph.

# CliQ III DIN Rail Power Supply

## 24V 120W 1 Phase / DRP-24V120W1C□N

### Power Boost

Power Boost is the reserve power available constantly that allows reliable startup to support sudden and short spike of loads with high inrush current typically during turn on to remove the need of more expensive higher rated power supply unit. After the output has reached its steady state set value, the power supply can support surge loads with a higher short-term power demand up to 150% of maximum rated load ( $I_o$  Max), for a typical duration of 5 seconds. If the power boost lasts longer than typical duration, the output current will limit to 5.5A typ. and output voltage will start to droop, refer to the details in overload & overcurrent protections and the next Power Boost will be available after power boost recovery time defined on Page 4. In order to avoid this, need to maintain the duty cycle & recovery time to ensure that average (R.M.S) output power shall not exceed the continuous maximum, see duty cycle calculation below.

Fig. 9 Duty Cycle Calculation

$$\text{Duty cycle (\%)} = \frac{T_P}{\text{Total Time}}$$

$$\text{Average Output Power (P}_{Avg}\text{)} = \frac{(\text{Power Boost} \times T_P) + (\text{Non-Peak Power} \times T_N)}{\text{Total Time}}$$

OR

$$\text{Non-Peak Power} = \frac{(\text{P}_{Avg} \times \text{Total Time}) - (\text{Power Boost} \times T_P)}{T_N}$$

### ■ An example of Power Boost and Average Output Power

| Power Boost | Peak Power (W <sub>P</sub> ) | Power Boost Duration (T <sub>P</sub> ) | Duty Cycle | Non-Peak Power (W <sub>N</sub> ) | Non-Peak Power Duration (T <sub>N</sub> ) | Total Time (T) |
|-------------|------------------------------|--|------------|----------------------------------|---|----------------|
| 150%        | 180                          | 1 sec                                  | 10%        | 113W                             | 9 sec                                     | 10 sec         |

# CliQ III DIN Rail Power Supply

## 24V 120W 1 Phase / DRP-24V120W1C□N

### Advanced Power Boost (APB)

With multiple loads connected in a system and due to one of fault load a large inrush current is drawn (demanded), this will be detected by APB. This product has a feature of APB up to 200% load for 50ms.

The following waveforms demonstrate the typical output voltage and output current when APB is activated.

Fig. 10 APB 200% of nominal output current for 50ms

### External Input Protection Device

The unit is protected at the L pin, with an internal fuse that cannot be replaced. The power supply has been tested and approved on 20A (UL) and 16A (IEC) branch circuits without additional protection device. An external protection device is only required if the supplying branch has an ampacity greater than above. Thus, if an external protective device is necessary, or, utilized, please refer a minimum value in instruction sheet with 6A B- or 3A C- characteristic breaker.

# CliQ III DIN Rail Power Supply

## 24V 120W 1 Phase / DRP-24V120W1C□N

### Operating Mode

#### ■ Redundant Operation

In order to ensure proper redundant operation for the power supply units (PSUs), the output voltage difference between the two units must be kept at 0.45~0.50V for these 24V supplies. Follow simple steps given below to set them up for the redundant operation:

##### Step 1.

Measure output voltage of PSU 1 and PSU 2. If PSU 1 is the master unit, then  $V_O$  of PSU 1 must be higher than PSU 2. In order to set the output voltage, individually connect each power supply to 50% of rated load at any line voltage, and set the PSU 1 and PSU 2 output voltage.

##### Step 2.

Connect the power supply units PSU 1 and PSU 2 to Vin 1 & Vin 2, respectively, of the DRR-20N (or 20A) module shown on the right of above diagram.

##### Step 3.

Connect the system load to  $V_{out}$ . Please note that output voltage  $V_{out}$  from DRR module will be =  $V_O$  (output voltage of power supply) –  $V_{drop}^*$  (in DRR module).

\* $V_{drop}$  will vary from 0.60V to 0.90V (Typical 0.65V) depending on the load current and surrounding air temperature.

#### ■ Parallel Operation

The power supply units (PSUs) can also be used for parallel operation in order to increase the output power. The difference in output voltage between the two units must be kept to within 25mV of each other. This difference must be verified with the same output load connected independently to each unit.

Parameters such as EMI, inrush current, leakage current, PARD, start up time will be different from those on the datasheet, when two units are connected in parallel. The user will need to verify that any differences will still allow the two power supplies connected in parallel will work properly in their product/application.

\*\*The Signal GND in the DRR module is for the built-in LED and DC OK signals. The Output GND terminals from the two PSU's do not need to be connected to the Signal GND terminal.

Fig. 11 Redundant Operation Connection Diagram

Fig. 12 Parallel Operation Connection Diagram

# CliQ III DIN Rail Power Supply

## 24V 120W 1 Phase / DRP-24V120W1C□N

Fig. 13 Series Operation Connection Diagram

### Series Operation

Delta's CliQ III can be connected in series to increase the output voltage as shown in figure above. Only power supply from the same product series, and with the same rated output current, can be used. The maximum load current should not exceed the smallest rated output current. Any number of power supplies can be connected in series. User must note that an output voltage > 60Vdc will not meet SELV requirements and could be dangerous to user, the total voltage shall not exceed 150Vdc. Installation a protection against the touching is a must and connect the output ground to earth when output voltage is not SELV. A diode in reverse bias must be added across output terminals of each power supply, this is to prevent -V voltage being applied to other power supply in fault conditions such as short circuit across load. During the short circuit -V<sub>1</sub> & +V<sub>1</sub> will come across +V<sub>2</sub> & -V<sub>2</sub> which means connecting 2 power supplies in opposite polarity and may cause damage to power supply. With reverse bias diodes in place the voltage across each power supply will be restricted to one diode drop – approximately 0.7V to 1.0V. It is recommended to provide sufficient voltage de-rating for diodes with 2 times the voltage rating of series output voltage. E.g. the two 24V power supplies are connected in series, the total voltage is 48 volts. Hence, recommended to use diodes with reverse voltage rating of 2x48=96 volts. Therefore, diodes with reverse voltage rating of 100 volts can be used.

During the short circuit condition, the current through diodes will be large, hence it is recommended that diodes to be least twice the current rating of the power supply.

The turn ON would be non-monotonic as the power supply with the fastest startup time and rise time will turn on first. As a result, the combined output voltage waveform of the 2 power supplies connected in series will include a step.

User must consider to verify parameters such as EMI, inrush current, leakage current, PARD, start up time would differ from datasheet numbers as multiple power supplies in series.

## 24V 120W 1 Phase / DRP-24V120W1C□N

Fig. 14 DC Input Operation Connection Diagram

### ■ DC Input Operation

#### Step 1.

Use a battery or similar DC source.

#### Step 2.

Connect +pole to L and -pole to N.

#### Step 3.

Connect the PE terminal to an earth wire or to the machine ground.

Fig. 15 2 of 3 Phase System Input Operation Connection Diagram

### ■ 2 of 3 Phase System Input Operation

Delta's CliQ III can use on 2 of 3 phase system. Please refer to the following step.

#### Step 1.

The input voltage applied from Line to Neutral is below the maximum rated input. The input voltage shall be below 240Vac +10%.

#### Step 2.

The external protector is needed on N (Neutral) input line to secure a safety. N line does not have internal fuse protection. An appropriate fuse or circuit breaker should be connected in series with N input line connection like the following.

### Others

#### Conformal Coating

#### The Protective Coating Technology

Delta Electronics Group has designed the perfect dipping technique which penetrates everywhere including under device, and prevents leakage. The conformal coating dipping can be applied to PCBAs or circuit board. The coating preserves the performance of precision electronic primarily by preventing ionizable contaminants such as salt from reaching circuit nodes, where the material slumps around sharp edges. This can be a problem especially in highly conversing atmosphere.

#### PFC – Norm EN 61000-3-2

#### Line Current Harmonic content

Typically, the input current waveform is not sinusoidal due to the periodic peak charging of the input capacitor. In industrial environments, compliance with EN 61000-3-2 is only necessary under special conditions. Complying to this standard can have some technical drawbacks, such as lower efficiency; and, can also result in higher product cost. Frequently, the user does not profit from compliance to this standard; therefore, it is important to know whether it is mandatory to meet this standard for a specific application.
